DEMO SCRIPT

Peak load demo script (10 minutes)

Daniel Okafor, Senior Solutions Architect

Shows a booking site holding up during a spike: cached where it can be, protected and scaled where it can't. Use with the "Booking and checkout at peak demand" reference architecture.

Before the call

- Deploy the demo app; warm one destination page and leave another cold.
- Open Observability, the Firewall tab and a terminal side by side.

Flow

MIN	SHOW	SAY
0-2	The destination page; `curl -I` twice: `x-vercel-cache: MISS`, then `HIT`	"Everything that's the same for every traveller never touches your origin."
2-4	Publish a price change in the CMS; the page updates in under a second	"Cached doesn't mean stale: a change purges every region in about 300 ms."
4-6	Run the load test; requests climb, function invocations stay flat	"Request collapsing means one origin call per region, not one per visitor."
6-8	Firewall tab: the bot run blocked by BotID and a rate limit	"Scrapers stop holding your inventory."
8-10	Rolling Release at 5% with Speed Insights compared	"You ship the risky change to 5% and promote on evidence."

Close

Propose a POV on their next peak event: same load shape, their real pages, success measured on p95 booking latency and conversion.
